

POINT 1 - MARTÍN'S SPECIFICATION

1.1 Annotations

A. Clear / testable statements

#	Statement	Section
A1	<i>“Empty/no-match filters return the full or an empty list , never an error.”</i>	Contract , BrowseCatalog
A2	<i>“A card with zero listings still returns from the catalog with an empty listings array, never an error.”</i>	Success Signal
A3	<i>“Purchasing a verified-business listing returns an OrderId and decrements quantity; purchasing an individual-seller listing errors with NotBusinessListing rather than silently succeeding.”</i>	Success Signal
A4	<i>“Listing as a first-time individual seller who hasn't completed the profile step errors with IndividualSellerProfileIncomplete.”</i>	Success Signal
A5	All 13 Contract operations carry an explicit Errors: clause	Contract
A6	<i>“time series {date, totalValue (COP)}”</i> , output shape fully defined	Contract , GetCollectionValueHistory

B. Vague or compound statements

#	Statement (section)	Problem
B1	<i>“Clear boundaries are required around user-generated content... to keep displayed information reliable”</i> (Constraints)	Forbids nothing and names no boundary. The companion claims every constraint passed a <i>“decoration test , a constraint that forbids nothing was rejected”</i> ; this is the one that survived it.
B2	<i>“a short profile step (short of business verification)”</i> (Capabilities)	<i>“Short”</i> is unverifiable. The fields are legitimately a Non-Goal, but the adjective smuggles in an unstated size requirement.
B3	<i>“historical trend (latter two as USD/COP pairs)”</i> (Contract , GetCardDetail)	No shape: one value, a delta, a series, a window? Inconsistent with A6, which defines the same kind of data precisely.

#	Statement (section)	Problem
B4	<i>“Individual sellers are reached via a generated external contact message; verified businesses are reached via in-app messaging and support in-platform purchase , individual-seller listings never do.”</i> (Capabilities)	Four requirements in one bullet, each mapping to a different Contract operation.
B5	<i>“Users add cards/products to one or more personal collections regardless of source, tagged by origin, and organize them into named groupings viewable as a virtual binder.”</i> (Capabilities)	Four requirements in one bullet. <i>“Virtual binder”</i> is undefined , Mateo’s spec at least has <i>“optional binder position”</i> .
B6	<i>“Admins review, approve, or reject pending business applications and moderate listings/reviews.”</i> (Capabilities)	The moderation half has no Contract operation at all , a capability with no boundary.

C. Hidden architecture / design decisions

#	Item	Why it’s a hidden decision
C1	Pseudo-signature form Operation(inputs) → output across all 13 operations	Presumes a synchronous single-call interface. Companion anticipates the objection and defends it as the resolution of the “no code vs. exact signatures” tension , defensible, but still a commitment.
C2	Named error identifiers (SellerNotVerified, NotIndividualSellerListing...)	An error-code taxonomy , an API artifact. High testability value, never acknowledged as a design choice.
C3	source: PlatformPurchase / Manual in AddToCollection	An enum literal embedded in an interface. Mateo’s spec states the same idea as a required field rather than a literal.
C4	<i>“(COP)”</i> baked into Contract return types	Currency becomes structural; multi-currency later is a Contract change, not configuration. Deliberate per Key Decision 6(b).

D. Risky assumptions

Author-flagged (4 risky / 3 safe) are all genuine: profile-step sufficiency, individual-seller review gate, bundle-inventory + account-transition (merged), purchase-does-not-auto-add-to-collection.

#	Unflagged assumption (reviewer-added)	What breaks
D1	That a catalog data source exists at all , never named, no constraint	BrowseCatalog and GetCardDetail have nothing to return. Mateo's spec ranks this as its single point of failure; Martín's most severe risk is invisible in its own register.
D2	That showing Pokémon names/images is legally available	Same blast radius as D1. No IP constraint anywhere.
D3	That legalIdentity needs no data-protection rule	SubmitBusinessApplication collects regulated data (Ley 1581) with no handling rule stated.
D4	That no performance or scale expectation exists	Zero non-functional constraints. "Browse the catalog" is satisfied at 50 entities or 50,000, at 200 ms or 20 s.
D5	That <i>"last transaction price"</i> is observable	Individual-seller sales are explicitly off-platform, so most transactions are invisible. The price model quietly depends on business sales being the only real data.

1.2 Verdict Table

Dimension	Rating	Evidence (quote + section)	Why it matters
Clarity	Medium	Strong: <i>"never an error"</i> (Contract). Weak: <i>"Clear boundaries are required around user-generated content"</i> (Constraints); <i>"a short profile step"</i> (Capabilities)	The Contract is precise; the prose constraints are not. "Required around" and "keep reliable" become hidden design decisions the moment someone implements moderation.
Scope control	Strong	<i>"In-platform payment processing for individual-seller sales (external handoff only); for business purchases, only the payment gateway/provider details are excluded."</i> (Non-Goals)	Deliberately asymmetric, and it blocks the most likely creep in a marketplace. Key Decision 7 records merging the two payment bullets precisely because adjacency made them <i>"easy to misread as contradictory"</i> , scope was defended, not just listed.
Verifiability	Strong	<i>"Reviewing a verified business without a completed purchase errors with NotVerifiedPurchaser; the same action against an individual seller succeeds without that check."</i> (Success Signal)	7 of 7 signals are binary and name an operation plus an outcome. One gap: the GetCollectionValueHistory signal depends on the price-estimation algorithm, which is a Non-Goal , it cannot be run today.
Atomicity	Weak	B4 and B5 above , four requirements per bullet	Compound requirements can't be individually accepted, estimated or

Dimension	Rating	Evidence (quote + section)	Why it matters
			traced. Key Decision 8 confirms the merges were a page-budget choice, so the cost is known , but it is paid at decomposition time.
Consistency	Medium	(i) <i>“listing cards, bundles, or sealed products”</i> (Capabilities) vs <i>“itemRef: card or BundleId”</i> (Contract) , sealed products have no type and no applicable filter. (ii) CreateListing error SellerNotVerified vs <i>“Any non-business account can sell individually”</i> (Capabilities) and <i>“Individual sellers need no business-style verification”</i> (Constraints)	(ii) is the dangerous one: an implementer must decide what SellerNotVerified means for a seller type the spec says is never verified. Unlike Mateo’s payment contradiction, neither is flagged anywhere.
Impl. independence	Medium	CreateListing(sellerId, itemRef, price, quantity, condition?) → ListingId (Contract), plus the error taxonomy; counterweight <i>“must not fix module decomposition, database schema, UI/visual design, deployment architecture, or technology stack”</i> (Constraints)	Optional-parameter syntax, an enum literal and a fixed error vocabulary are interface commitments made before design. Key Decision 1 argues the assignment’s <i>“exact function/API signatures”</i> wording forced it , reasonable, but freedom was traded.
Traceability	Strong (<i>package</i>) / Weak (<i>spec alone</i>)	Six numbered stages with commit hashes (1477625 ... 2e8a39b), <i>“51 append-only entries, every one tagged --by ai”</i> , rubric-by-rubric self-review (companion)	Best traceability artifact in the pair: every change is attributable to a stage, an actor and a reason. But the spec has no IDs , all references are prose, so once separated from the companion it cannot be cited in a change request.
Decomposition readiness	Medium	13 operations cluster into catalog / listings & bundles / onboarding & verification / contact & purchase / collections & wishlist / reviews. Blocked by B6 (moderation, no operation) and the deferred valuation algorithm	Strong seam map, two unbuildable areas. Compound bullets also mean one capability line spans several future modules.
